DAD MANUFACTURING

DIVERSIFIED · ACCURATE · DEPENDABLE

Shipping QC

Every shipment signed off, time-stamped and traceable, from a one-inch part to a fifty-foot vessel.

PRODUCT OVERVIEW · NOVEMBER 2026

WHAT IT DOES

One signed record for every shipment

Quality checks, materials, custody and documents live together, with a name and a time on every step.

Any size, one system

Checklists adapt to the job: small parts, standard, sanitary, pressure, and loads up to 50 feet and beyond.

Built for the dock

Phones, tablets and desktop. Keeps working when Wi-Fi drops, then syncs with the original times.

Nothing slips quietly

Failures raise flags and alert QC. Releasing with open items needs a written reason.

Checklists per job

Stack templates for the work, then edit for the customer. Required values, photos and documents.

PIN sign-offs

Your own login plus your PIN on every sign-off. Exact time and name, recorded permanently.

Hold points

Critical checks need a second QC person to verify, never the one who signed.

Materials & traceability

Heat and lot numbers, filler wire, gas, passivation, packaging, and the gauge used for each measurement.

Custody timeline

Ready, loaded, picked up, delivered: with time, place, GPS and the driver's signature on screen.

Release package & label

A branded PDF for the customer and a QR label that reads HOLD until QC releases.

HOW A SHIPMENT MOVES

From order to customer, every step on the record

1

Intake

Enter the job or import a spreadsheet from the ERP. Pick the plant. Checklist modules are suggested from size and notes.

SHIPPING

2

Checklist

Each shipment gets its own copy of approved templates, editable for the customer and the job.

QC

3

Sign-off

Pass, fail or N/A with a PIN. Values, photos, documents and gauges where required. Hold points get a second signer.

OPERATORS · INSPECTORS

4

QC release

The QC manager releases with a PIN. Open items must be listed and explained. The label flips from HOLD to RELEASED.

QC MANAGER

5

Load & custody

Ready, loaded, picked up. Carrier, driver, BOL, seal, permits. Time, place, GPS and a signature at pickup.

SHIPPING

6

Package & records

A branded PDF package, optionally emailed to the customer, plus a permanent tamper-evident audit trail.

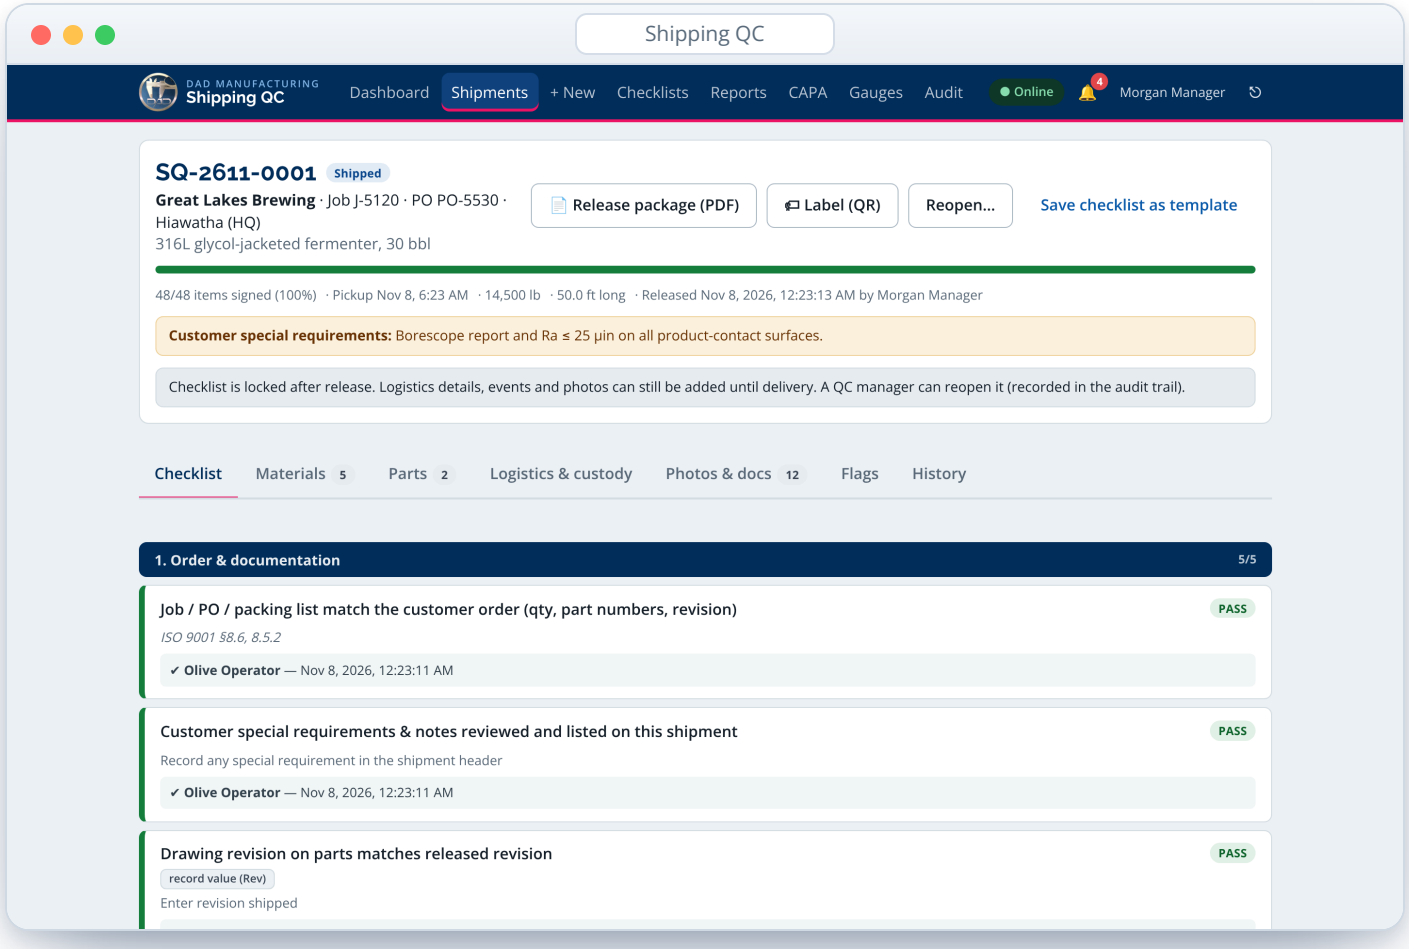

EVERYONE · AUDITORS

When something fails, QC knows immediately.

A failed item raises a flag and alerts QC by app, and optionally email or Teams. Work continues, but open flags are listed at release and printed on the package.

AT THE DESK

Every sign-off says who and when

1. **Name and exact time**
   On every item, in the shop's own time zone. Sign-offs are never edited, only revoked with a reason.

2. **Hold points**
   A different QC person verifies critical checks before the shipment can be released cleanly.

3. **Gauge on record**
   A measurement logs the instrument. Out-of-calibration gauges are rejected.

CLOSE-UP · SURFACE FINISH CHECK

Product-contact surface finish measured (Ra) and within spec

record value (µin Ra) | QC inspector+ signs | hold point — 2nd person verifies

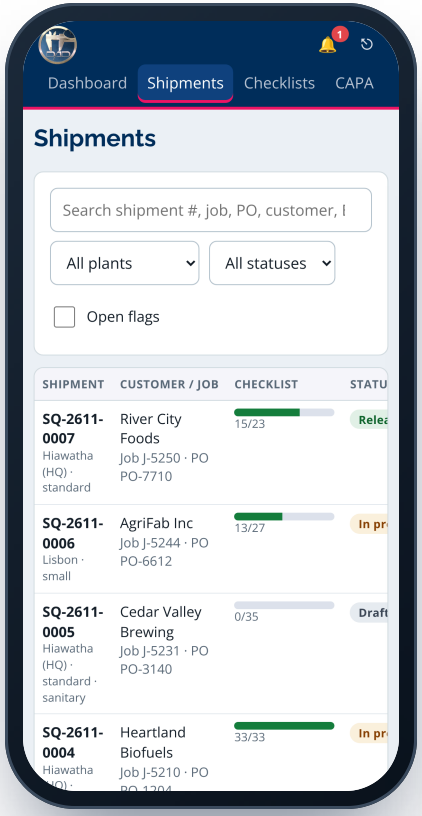

e.g. ≤ 32 µin Ra (3-A) / ≤ 20 µin Ra (BPE SF2) — use the customer spec · *ASME BPE SF / 3-A 00-01*

Recorded: 18 µin Ra · gauge PRO-17
✓ **Ira Inspector** — Nov 8, 2026, 12:23:12 AM
✓ Verified by **Jules Inspector** — Nov 8, 2026, 12:23:12 AM

ON THE DOCK

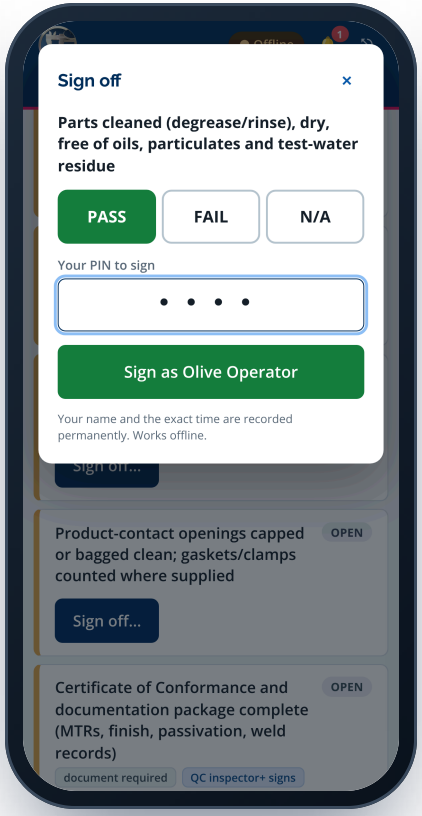

Made for gloves, glare and spotty Wi-Fi

Big touch targets, the camera for photos and scanning, and an offline mode that never loses a sign-off.

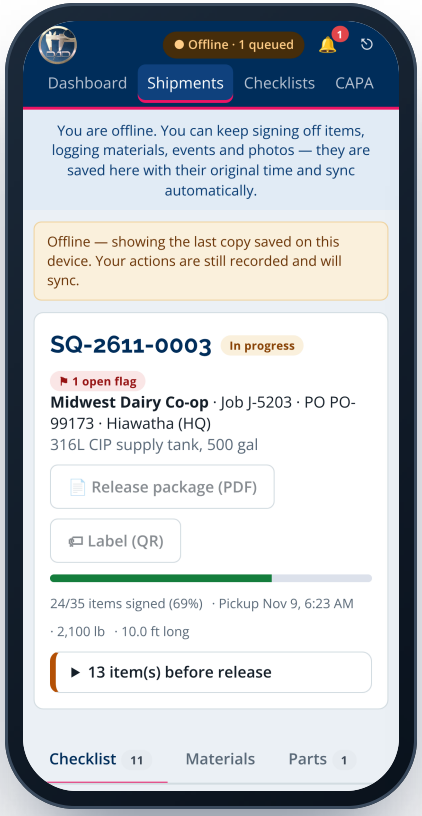

Find a shipment

Search by job, PO, heat number, or scan the label QR.

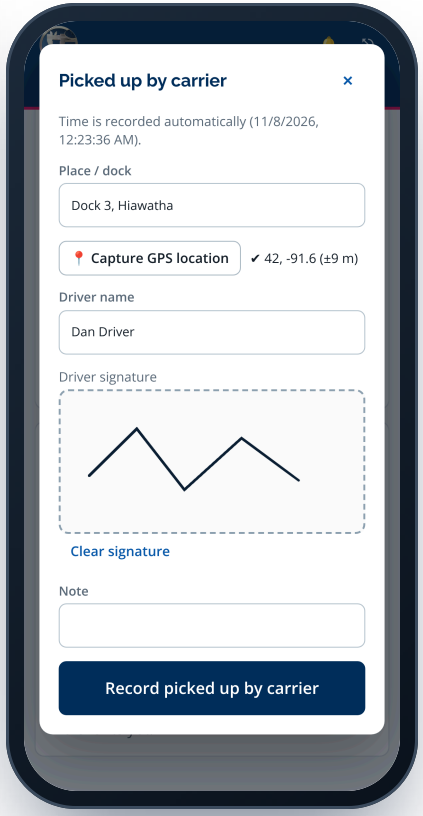

Sign with your PIN

Pass, fail or N/A. Your name and the time are stamped.

Keeps working offline

Queued with the original time, synced automatically.

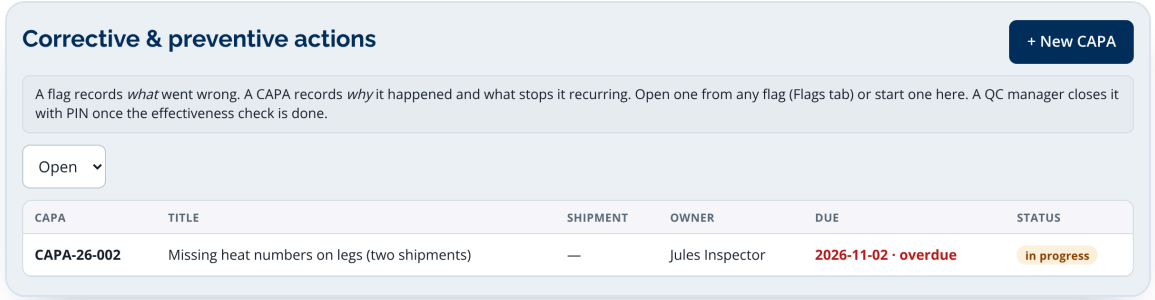

Pickup, signed

Driver signs on screen. GPS and time recorded.

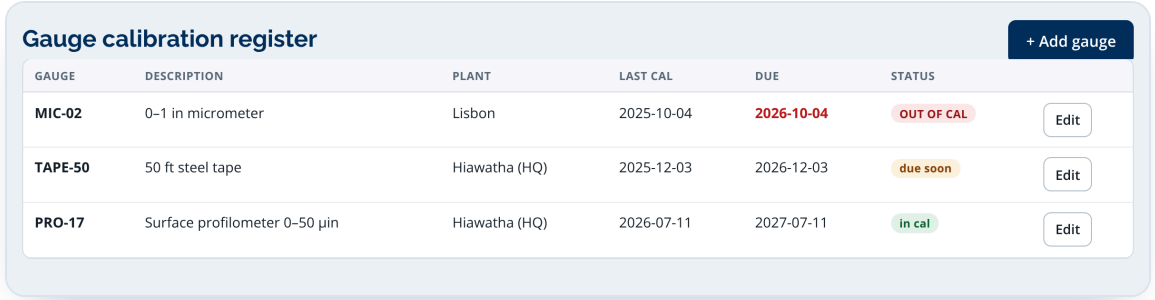

QUALITY CONTROL BUILT IN

From a single flag to the whole month

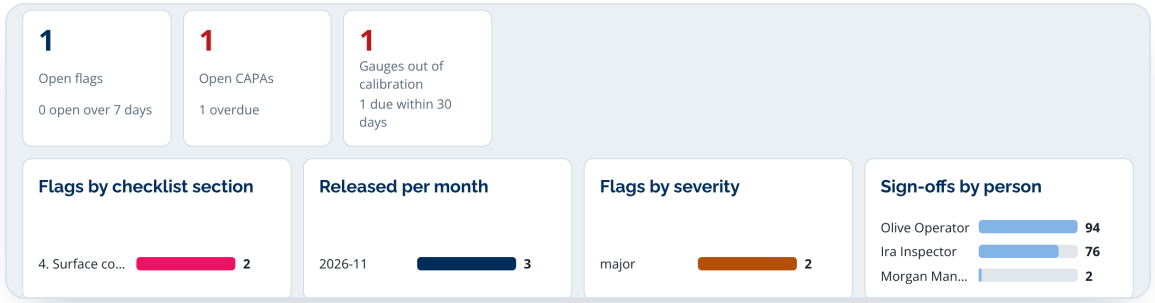

Corrective actions

Open a CAPA from any flag. It closes only with root cause, corrective action and an effectiveness check, signed by a QC manager.

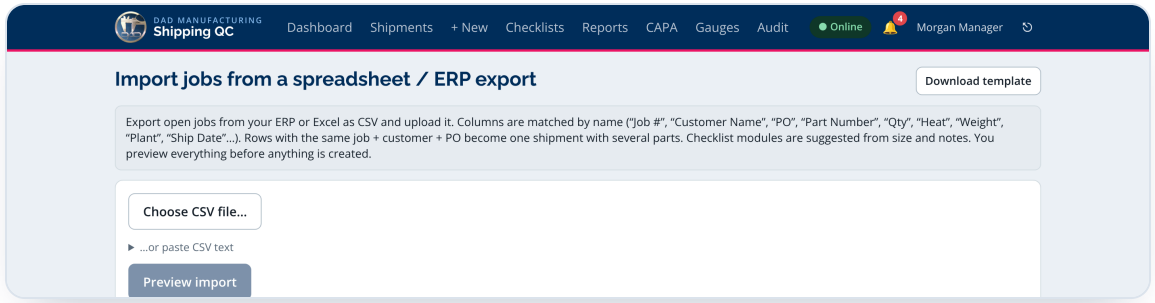

Gauge calibration register

Due dates tracked, warnings 30 days ahead, and sign-offs using an expired gauge are blocked.

Quality reports

First-pass release, on-time pickup, time to release, and flags by checklist section, computed from the signed records.

Import from the ERP

Upload a spreadsheet export. Columns are matched by name, jobs are grouped, and you preview everything before it is created.

WHAT THE CUSTOMER RECEIVES

A release package worth handing over

Branded PDF package

Checklist with who and when, materials with heat numbers, custody with signature and GPS, flags, photos and an integrity line.

QR label that says HOLD

Prints at 4×6. It reads HOLD until QC releases, so an unreleased load is hard to ship by mistake.

Email it, with a fingerprint

After release, send the package straight to the customer's contact. The file's fingerprint is recorded in the audit trail.

AFTER RELEASE

RECORDS YOU CAN STAND BEHIND

Built to survive an audit

Tamper-evident audit trail

Every action is logged append-only, each entry fingerprinted with the one before it. Verify the chain any time and keep a weekly anchor off the server.

Backups you can prove

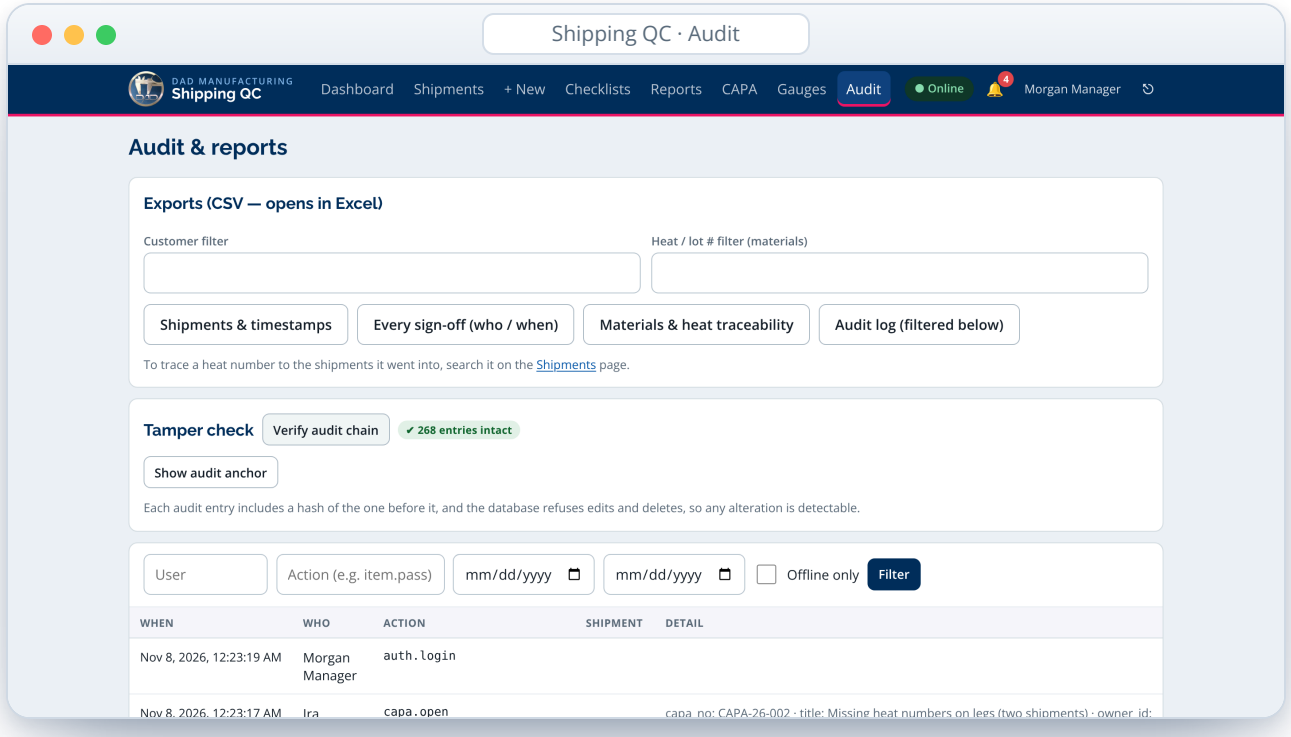

One command backs up the database and every photo, then verifies it. Restores are re-checked against the original.

Real accounts, real signatures

Individual logins, PINs, optional two-factor sign-in, lockouts, and forced first-login password change. Offline sign-offs are proven by the PIN, which is never stored.

Document control

Checklist templates are approved by a QC manager. Any edit clears the approval until it is signed again.

40+
automated tests, run on every change

0
accessibility violations on 16 screens

0
known dependency vulnerabilities

GETTING STARTED

A four-week pilot, alongside paper

WEEK 0 SET UP

Server, HTTPS, accounts, templates

QC reviews and approves each checklist. Gauges entered. Everyone sets a PIN and signs one practice item.

WEEK 1 FLOOR

Operators and inspectors beside paper

Ten real shipments through the app, with the paper process running in parallel.

WEEK 2 DOCK

Shipping, labels, pickups, offline

Five pickups with driver signatures and GPS. Walk to a Wi-Fi dead spot and prove offline sync.

WEEK 3 RELEASE

QC releases through the app

First CAPA, gauge and report reviews. Every release package checked against the paper record.

WEEK 4 EXIT

Fixes, second plant, exit review

Zero shipments left without release, restore test passed, sign-off by QC and plant management.

What we need from DAD

Decisions that shape the rollout.

1. **Which ERP does DAD use?** Live integration depends on it. Spreadsheet import works today.
2. **A real shipping checklist and a customer's package format** so we can match them.
3. **QC manager review** of every checklist line before first use.
4. **Records-retention period** for shipping quality records.
5. **Hosting and HTTPS** with IT. Camera, GPS and offline mode need it.
6. **Any customers needing FDA-style e-signature validation?** That is a separate scope.
